

VAULT.Investments

Whitepaper

Date: 3 May 2019
Version: 1.0

Abstract

From 2017 and also in the first few months of 2018, we saw the golden age of masternode projects, where there was a huge demand for all the various projects that were appearing. But where there's gold and wealth there are always thieves and crooks and the masternode space got more than it's fair share of unsavoury characters and this only has gotten worse right up to the present day.

It is said that 95% of all masternode projects will fail through intended scams, or go to 0 (1 sat) due to a number of factors. This is not exactly welcoming news to entice new, or past "damaged" investors to inject more funds into the current "lottery" of masternode investing.

To be fair it is thought that many of these scams and exits didn't start out in this way. But many of them are left with no choice when their dreams come crashing down around them, through no fault of their own. With all this uncertainty in the markets and the fear of failure, many will launch with an anonymous team so that if things don't work out they can exit without leaving any trace of their identity.

The new investment platform from VAULT aims to make the masternode space more safe for investors and startup projects. The new feature at the heart of the investment platform is called CRYO, which is derived from cryogenics - low temperature physics.

Apart from future new features, we will obviously be hosting masternodes in a secure environment.

Introduction

VAULT is an investment platform for investors. It will use masternodes and Proof-of-Stake (PoS) concept to power the blockchain for the platform coin VAULT. The secure platform will allow the deposit, withdrawal and storage of investor collateral with all the benefits and rewards of running your own masternodes or staking for rewards. An investment platform of this nature means that there is no maintenance of, or need to have your wallet open and connected to the internet at all times to participate in PoS. All listed projects will operate on an instant share basis, meaning that there is no delay in waiting for a masternode to fill up before receiving rewards. You can take your collateral out at anytime or choose to reinvest for maximum effect.

By placing your investments in the safe care of a proven public team, you can sit back and enjoy a hassle free passive income. The VAULT team have already been around running their own project PAWS since Q 4 2018, having faced and conquered many obstacles along the way. The project support has been very responsive with help even have been given to other projects behind the scenes, during the difficult times. Over the past 12 months, we have stood back and observed all of the eventualities that have occurred and we believe that we have identified the fundamental flaws in masternode projects. It is now time for masternode projects to join forces to put investor confidence back into the market for a fresh injection of funds.

The team behind VAULT is a strong public team, that also is the driving force behind PAWS Fund, will give more confidence to investors as they know who they are dealing with and who is in charge of looking after their best interests, making this a good project. In the new Discord server there will be responsive support for all the day to day issues, just like investors are used to receiving on the PAWS platform.

The VAULT coin will be the platform means of payment for investors and for projects listing on the platform. Projects listing in the platform or CRYO program will pay in a combination of VAULT and PAWS. All platform fees will be paid with VAULT. The VAULT masternode will have additional benefits and rewards. It will be our first project listed in the CRYO program and give the first access to presales for the next listed project through our exclusive club for CRYO investors.

The VAULT coin will also be marketed towards security and investment as a means of payment for subscriptions and products. When you hold VAULT you will be holding much more than a coin, with many planned offers and monthly benefits for loyal investors.

Investment in CRYO projects, will mean that you are entering a game changing program for quality projects that are ranked by 3 levels of trust. These projects will have been put through their paces by the time they reach our platform. CRYO investors have their own exclusive club where they get to discuss business with the project's owners before they go to presale.

CRYO investors get access to presales first. They will know what they are buying and know that their investments are protected when listed on our CRYO program. The CRYO program is meant to provide a safe haven for real projects that need time to grow and mature. Investors will have their own safe haven knowing that unsavoury presale buyers and rogue project owners won't be flooding exchanges with more supply than demand can handle.

Rewards can still be taken from CRYO projects or reinvested but by keeping the masternodes locked, this ensures access to all future presale projects.

Market Research

Benefits of creating a masternode project

The benefits of starting a masternode project are, that your project instantly gets its own currency and ecosystem. The currency can have specific features that provide functionality to your project, other than it being used for payment.

The possibility to sell presale masternodes allows for raising a start capital in bitcoins, while the possibility to generate a premine allows for startup funds in your own blockchain currency.

The automatic generation of coins for each block generated, creates an interest for the coins, while a product is being developed. This allows for a community to be built up and information spread about the projects.

Challenges

In recent times various challenges have emerged for investors, making it very hard to trust a new project. This makes it more difficult for a lot of investors to keep investing in new projects and ideas. It is also a challenge for those projects that have a great idea but are afraid to follow in the footsteps of other great projects that in the end had to give up. The various challenges and problems can be categorised as follows.

Scam projects

A scam is something which has been carefully planned and setup with the sole purpose to deceive and cheat investors out of their money. Scammers can use all sorts of elaborate schemes and tricks, with incentives such as a high unsustainable return or promises of “impossible” development products. They will do anything and tell you wild fabrications to con you out of your money. In masternodes, they can be very hard to predict, some will have a short life. Others can go on for months with organised pump and dumps and some will even be appearing to “deliver” to prolong the life of the project for as long as possible, so as to take as much profit out before the inevitable.

It is believed that the same group could be responsible for most of the intended scam and exit projects that have spiked in the past 6 months. It could even be the same dev that is offering his services at a cost to anyone, leaving the door wide open for crooks. There has been every type of trick and deception used to lure investors in, to hand

over their cash. Most will use the “anonymous” trait that Satoshi Nakamoto (the founder of bitcoin and blockchain) chose for himself but he didn’t ask anyone to give him money or invest in his project, he handed over the code and there was no scam or exit that resulted on anyone losing money, so there was no harm for him to remain anonymous. Some projects will disclose “questionable” public teams that will pass the inexperienced eye and many of these will tempt you with high ROI and are no more than a ponzi scheme for as long as the project can remain liquid.

Exit project

An exit is when a team will go missing and effectively leave the project and everything behind but not all exits are intended scams, however they both have the same effect, a loss for investors. Any exit, even those that were “good” projects is made much easier with an anonymous team.

Anonymity in Crypto

There can be a number of reasons why projects remain anonymous, possible restrictions due to real life work commitments or even due to the country of residence.

However, did Satoshi Nakamoto really intend for everyone to be anonymous? Both investors and project owners? Surely it is an investors right to remain anonymous but were project owners supposed to be faceless? When you go into a store and buy a candy bar you don’t have to reveal your identity but you should be able to track who owns the store if there is a problem. This is why VAULT believes that it is time for projects to stop hiding behind the unnecessary guise of anonymity. It is time for projects to show their face and to stand up and be counted. It is time for investors to have real projects to invest in with public teams and verified identities as a point of contact.

VAULT has spent over 12 months observing and gathering data on the masternode space to identify the pitfalls of masternode investing and why many “good” projects have not had the desired effect you would have expected. Something has to be done to preserve the future of new startups, real promising projects, to give them time to mature.

CRYO - The Solution

VAULT will do what it can to clean up the space with it’s 3 levels of ranking for CRYO projects based on transparency and trust.

VAULT is the first investment platform to target real investors and bridge the gap with cryptocurrency and traditional investors. At the core of VAULTs investment platform we have the CRYO feature. VAULT will put investors first and it will also put CRYO projects first. With 2 firsts, this really is a game changer in the masternode space.

We believe that if CRYO would have been around 12 months ago, many scams would have failed from the off and many real projects would not have failed. We would have had more transparency in teams and many projects would be sitting much stronger than they are today with the protection they would have received at their beginnings, from being involved with the CRYO program.

Platform security, placing your investment in the vault

All projects are sandboxed with no intervention with any other listed project. This means that if in the unlikely event that one wallet is compromised, that other wallets will not be affected.

No outside developers are used for security sensitive development. This means that no developers that have not proven themselves to be trustworthy will be allowed to work on the components of the platform that could compromise our customers investments. Additionally, all listed project wallets are screened and built from source code to help prevent rogue code in the binary wallets to be added, if it is not present in the source code of the project.

Advantages for investors

Have you ever been the victim of an exit scam in a Masternode project? Have you ever had your coins stolen by someone pretending to help you? Have you ever been involved in a promising project, only to see it destroyed by presale buyers and others dumping more coins than the demand can handle?

VAULT has the solution Invest in CRYO approved projects with 3 levels of trust. All current holders of CRYO projects will get news of CRYO presales first.

Advantages for Project owners

New masternode projects often feel they have the perfect idea and want to safeguard it against groups of unsavoury investors. Investors that are only in it for what they can get out and have no empathy towards your dream, mission and vision.

VAULT can offer a solution with the CRYO Program. This is intended to be a safe haven for those projects that want to work on their ideas and solutions without being sidetracked by events on the exchanges.

The CRYO Program

The CRYO Program works by offering all new projects prior to presale stage the possibility to enlist. If they list, the presale nodes will be sent to a public address where they are frozen with staking turned off.

Each project will then specify the date of unfreeze (recommended 90 days). When the presale masternodes are sold the list of accounts that have purchased the presales will then be handed over to VAULT. VAULT will then deposit the coins into each account of the presale buyers and set the timer to the time of unfreeze.

One of the major advantages of listing your projects in CRYO is that you can effectively sell all you presale masternodes, even after going live on an exchange. With careful planning of your reward structure and the mechanics of CRYO, this should mean that the supply on exchanges should be low, with the best means to buy a full masternode from any unsold presales. Which you will have the option to sell above markets rates.

You are dealing with an experienced, proven credible public team and company that have been here before. You are more likely to get better quality investors that believe in your project for the long term. The usual bad actors that target quality projects won't be able to manipulate your exchange launch with mass numbers of masternodes to dump.

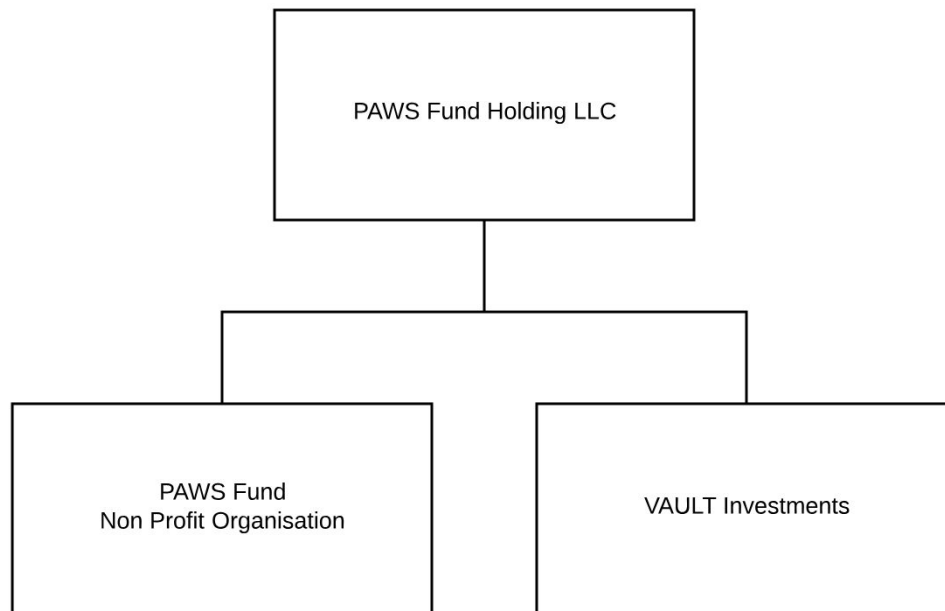

It will help protect you against unsavoury presale buyers that will dump their nodes for instant return and profit, which normally results in plummeting prices and it will help protect your project from dumped coins that have been scammed and stolen from your investors. It will also give your investors reassurance that their collateral is safe in a secure environment.

Finally, knowing that one of the possible reasons teams don't come out public, is for fear of failure. With the protection of CRYO, it can give you the confidence to unveil your identity and gain early team verification.

What is VAULT Investments?

Parent company

The parent company of VAULT Investments is PAWS Fund Holdings, LLC. Let that be clear for all. It is created by the same people that are behind PAWS Fund, which has a vision to create a global Animal Charity using the blockchain.

Our Vision

The mission of VAULT Investments, is to help new projects and companies that have a good idea, or concept for using the blockchain, to get through the startup phase.

We can help a new project with any part of the startup phases, such reviewing the project and looking through the business plan. We can help making or adjusting the whitepaper and we have the technical expertise to setup the new blockchain and help design a sustainable reward structure for your needs.

We all know how vulnerable a project is during the first weeks and months, where ROI often is high and the number of investors low. This allows for few investors to

accumulate large amounts of the currency which subsequently can be sold in large quantities to extract Bitcoin from a frail and vulnerable market.

VAULT Investments seeks to prevent this from happening, by locking those initial presale masternodes in, for a period agreed with the project owners. As such, the initial investors will only be able to receive rewards of their presale masternode(s) and will not be able to sell the collateral of those presale masternodes for as long as those are locked in the VAULT.

This will allow for a more stable price during the initial phase of the project, and the project will be able to work on their vision and product with less concern on the price of their coin through mass dumping.

Once the presale nodes are unfrozen, they can be added to VAULT Investments regular masternode hosting service. This will operate like many of the masternode hosting services already present in the market, where your coins will be stored securely.

As part of the PAWS Fund Holdings, LLC, it should be no secret, that VAULT Investments will be providing a source of income to the PAWS Fund Holding company and its Non Profit subsidiary.

VAULT seeks to add additional features to the platform, that will further protect the interests of startup projects on the blockchain as well as investors in any of the projects that are on our platform.

Funds and Premine

A total of 100,000 VAULT were mined during the launch of the network, or 0.47% of the total supply of 21 million VAULT that will ever be mined. Those VAULT were generated in block 1 and can be tracked in the explorer. After the presale masternode buyers were given their collateral. All remaining will only be sold after presale above market rates, frozen in the CRYO program.

Operational Fund

Since block 1,000, VAULT has been receiving 10% of each block reward to the Operational Fund, for expenses that VAULT will have in operating and developing the VAULT network.

The VAULT organization will rely solely on the operation fund and will not setup any corporate masternodes to earn rewards. All expenses will be covered by the aforementioned Operations fund.

Our Blockchain

VAULT has chosen to create a cryptocurrency, as it is one of the best modern methods for instantaneous transactions and minimal transaction fees. Due to the CRYO feature, it was vital for our investment platform to have its own currency right from the start.

Where fees are applicable, there will be an option to pay in VAULT for a 50% reduced rate to the listed coin.

Low ROI

What will differentiate this project and its currency and blockchain from many others, is that the ROI will be low right from the start, making it more believable and attractive to traditional real world investors. The platform aims to attract new investors based on its features, mission to make things better for newbies in masternode based projects and crypto in general.

It is aiming to improve conditions for new and veteran investors that may have been burned by past investments and lost money on their investments due to teams dumping the premine or presale buyers dumping their nodes prematurely.

It is also aiming to improve the situation for new genuine projects and help protect them from all the negatives that affect most projects.

The VAULT currency will be the first project enlisting on the VAULT platform using the CRYO feature. This means that investing in a VAULT masternode will not lead to other presale investors dumping prematurely.

Investing in the VAULT project will be a long term investment for those that support improving the instability that surrounds the masternode culture, at the present time.

The VAULT Investments Roadmap

Platform Introduction

On May the second 2019, the new platform will be released by the VAULT project. As stated before, the VAULT project is a 100% subsidiary of the PAWS Fund Holdings, LLC, a Florida limited liability company.

The new investment platform does what many other platforms do, which is host masternodes for various projects and protect the funds of those investing in those projects. The key difference is the CRYO Program at the heart of the platform.

The CRYO Program is intended to provide a safe haven for your dream projects. All new projects prior to presale stage are welcome to apply for our CRYO Program and all cases will be treated individually.

Exchanges

The VAULT project has initially no intention to use resources on many exchange listings or the qualifying factors that are required for CMC. Funds raised through presales will be used for paying fees on the investment platform itself for both projects listing and investors investing.

We intend to choose only a single exchange, to make it possible for people to get hold of the currency and use the platform.

Project Startup Services

VAULT Investments will not stop at providing a safe environment for any new project utilising a Proof-of-Stake blockchain. We will also offer custom turnkey services that will include but are not limited to:

- validate any new idea you might have,
- help verify the project and business plans.

We will also provide services to

- implement the blockchain for any new project,
- Setup a blockchain explorer,
- Compile the wallets and
- design a suitable reward scheme for the project at hand.

Our Technology

Coin Specifications

VAULT runs on its own blockchain based on a Proof-of-Stake model. Compared to the alternative, Proof-of-Work, which is known from cryptocurrencies such as Bitcoin and require heat-generating and power-consuming “miners”, the Proof-of-Stake model does not require a lot of energy or cooling to operate.

VAULT has the following coin specifications:

- Coin name: VAULT.Investments
- Ticker: VAULT
- Algorithm: (POW/POS) QUARK/POS
- Block reward: 1 VAULT, as specified below
- Masternode Collateral: 1000 VAULT
- Masternode reward: 89%
- Staking (POS) reward: 1%
- Operations Fund: 10%
- Block Time: 60 SECONDS
- Minimum Staking Maturity: 12 hours
- Total supply: 21 000 000 VAULT
- Premine 100 000 VAULT (0.47%)

The VAULT blockchain is based on the well-known PIVX platform and is forked from the latest 3.1 codebase. PoS (Proof-of-Stake) is known to be more energy efficient and has faster block times compared to many cryptocurrencies based on PoW, making transaction speeds much faster, and the transaction fees are typically lower.

The PoS network commonly uses masternodes in the network as a special type of node that contributes to the stability of the network. The masternode is a special type of “wallet” and can perform many functions in the network. The most commonly known function is the validation of transactions. Anyone can install and operate a masternode in the network, and the only requirement is that the user locks the required amount of currency in their wallet, for as long as the masternode is operational. In return, the masternode operator is paid a percentage of the block rewards generated each time a block is verified.

A common feature in the PIVX-based PoS network is the governance model which allows a masternode operator to vote on community proposals. VAULT is looking at using this feature in the future to vote for community proposals regarding the use of donation funds for charity purposes and to vote for any other proposal that concerns the future of VAULT.

Block Rewards

Block rewards are the number of VAULT generated each time a block is generated. Typically, this is split into 2 parts: a portion is paid to the masternode operators for stabilizing the network and verifying transactions performed in the network, and another portion is paid to the wallets that validate blocks, which is called staking. At VAULT, the block rewards are split into 3 parts: 89% is assigned to the masternode operators, 1% is assigned for staking and the final 10% is assigned to the VAULT operational fund.

The block reward scheme chosen by VAULT is quite a bit different than commonly seen with PoS blockchains. It is common to start with high block rewards to attract investors, which is then slowly reduced towards maturity of the network to avoid inflation. The problem with this type of scheme is that a small number of presale investors collect a large part of the available coins, which can result in price instability due to coins being sold in large numbers. This is commonly referred to as “dumping” and often causes the supply to exceed demand significantly in the early stages of a project, which in turn makes the price drop.

VAULT has chosen a very low block reward right from the start. The maximum should be no more than 300% ROI and if all mastenodes we sold before an exchange listing, this would result in 100% ROI.

The intended investors, are the ones that hope to change the masternode scenery through the implementation of CRYO. A long term investor will achieve ROI and more over a longer period. VAULT will also be the first coin in the CRYO program, showing how effective it is.

The VAULT Platform

The masternode and investment scene have experienced a growing number of available options. VAULT will add to those with its own investment platform. All collateral will be stored on the platform with no requirement to download or run a wallet and no expertise needed to setup and run a masternode. It will be a simple process to sign up for an account using Discord or Telegram and 2FA will be standard, allowing

users to secure their accounts. All rewards will be based on the collateral held in your various project accounts.

There will always be users that prefer to look after their own security and hold funds in their own wallets but we saw with the recent incident of malware in a projects wallet that even some experienced investors have been compromised.

Let VAULT take care of your investments with only a few clicks.

VAULT Platform will have security high on the agenda. All projects are sandboxed with no intervention with any other listed project. No outside developers are used for security sensitive development and all listed project wallets are screened and built from source code.

The CRYO feature for new startups

“CRYO Program” (as in CRYOgenics) for all new projects in presale stage.

CRYO for Project Owners:

All new projects in presale stage can apply for our Cryo Program. The collateral for presale masternodes are sent to a public address with staking turned off, awaiting the presale buyers. When they are sold all coins will be distributed to the accounts of presale buyers and frozen with only the rewards available for reinvestment or withdrawal. The timer will be set for the time of unfreeze (recommended 90 days).

Benefits:

When you enrol in the CRYO program, You are dealing with an experienced, proven credible public team and company that have been here before. You are more likely to get better quality investors that believe in your project for the long term. It will help protect you against unsavoury presale buyers that will dump their nodes for instant return and profit, which normally results in plummeting prices. It will give your investors reassurance that their collateral is safe in a secure environment.

All projects will pay an agreed fee for listing and they will be dealt with on an individual basis, full product support will be provided to help you get the optimum structure and launch. We are here to help you grow your business and add more credible projects for our investors.

Each CRYO project owner will be given their own private channel for discussions with all current CRYO investors This will be your own market-stall to interact and conduct your business with proven potential customers in preparation for your presale release.

CRYO puts trusted investors in direct contact with project owners in a private protected environment.

We have additional exciting features planned for CRYO, which will be revealed after our first project listing.

It will give your investors reassurance that their collateral is safe in a secure environment. Knowing that a lot of the reasons teams don't come out public is for fear of failure. It can give you the confidence to unveil your identity and gain early team verification.

CRYO Investors Benefits:

The platform enables us to make various benefits for projects that are listed on the CRYO Program. We could have a different prize to give away each month as we are intending to do with PAWS and VAULT holders.

We are also looking at making various levels of CRYO trust. We are considering features as shown below:

Bronze: Basic level, listed in CRYO

A project listed on the CRYO program, with no additional feature enabled, we could call a bronze level trust. An investor looking at a project like this will know that it is protected by our CRYO program at a basic level.

Silver: Intermediate level, listed in CRYO, Premine frozen

Additionally to being listed in our CRYO Program, enjoying basic protection against dumping of the presale nodes in the early days of the project lifecycle, we could offer to hold their premine funds and freeze them. This would be similar to how PAWS has placed their premine in a vault, which can only be unlocked by community voting. This is a good signal to send to potential investors, that this project can't and has no intention to dump the premine on the market during the startup phase of the project and do an exit scam as we have seen so many times.

Gold: Top Level (Top Dog), listed in CRYO, Premine frozen and team verified by VAULT

An additional layer of trust could be added to the silver level, making it our gold standard, by having the project verified by VAULT. This will send an additional signal to potential investors, that a project means real business by being verified and transparent, locking their premine for a period of time in our VAULT as well as the presale

masternodes being locked in our CRYO Program preventing those from being dumped on the market in the early stages of the project.

Additional features and benefits for project owners and investors

The platform will be able to provide additional features and benefits to investors if a project owner wishes to promote their project during the initial stages. We are open to many options which we can then implement on our platform for the investors for a particular CRYO enlisted project.

Meet the VAULT Team

Co-Founder and CEO: Ian Cubitt

Ian is the co-founder and CEO of the PAWS Fund and VAULT Investments. The mission of PAWS is to provide animals with the necessities for a happy and healthy life, including love and care. At first, the vision of PAWS was primarily focused on care and support for dogs and cats, but progressively extended outwards to wildlife and endangered wildlife.

Similarly the VAULT platform, with CRYO at the very center of it, is to improve the masternode space, where both projects and investors need a safer environment to invest.

Ian was born and raised in Northern Ireland and brings with him experience as Advertising Director with AdEngage Inc. and Media Breakaway LCC and has been the General Manager of Carebit since April 2018. Ian decided to create PAWS during the summer of 2018.

Ian was the public face of the PAWS Fund project even before the project was launched and works effortlessly on new ideas and has countless connections to create and implement new opportunities for PAWS and the VAULT platform.

LinkedIn: <https://www.linkedin.com/in/ijcubitt/>

Discord: @ian#4786 [ID: 396294854218481664]

Co-Founder and CTO: Jules Dubois

Jules is the co-founder and CTO of the PAWS Fund and VAULT Investments. Jules lives in France and is the lead developer of PAWS and VAULT. As our blockchain wizard, he ensures that the blockchain runs without flaws, and he is currently developing the PAWS Tracker tool as well as the VAULT Investment Platform that will be the basis of a series of PAWS services currently under development. Jules works as a Data Scientist for Thales and has previously worked for Alcatel-Lucent in Paris.

Jules drinks at least 5 cups of tea with milk daily and completed his first marathon in 2016!

LinkedIn: <https://www.linkedin.com/in/jules-dubois/>

Discord: @Jules#7692 [ID: 378124945621909505]

Co-Founder and COO: Jelle Borsje

Jelle joined the PAWS Fund team in a technical support role to help the PAWS community with problems related to masternodes, wallets, and to support the team with technical issues wherever necessary. Jelle has a background in IT as a network consultant, but since IT is his hobby, he has an interest in scripting, coding, and everything to do with Linux and the solutions that can be built with it. Jelle has more than 20 years of experience with implementing and troubleshooting networks, including security, LAN, and WAN technologies such as MPLS.

Jelle is originally from the Netherlands but has been living in Denmark for the past decade with his family and their 3 guinea pigs. He spends most of his time with his family and likes to mess around with his own servers and programs. Whenever he has some spare time, he goes out for a run to try and get some fresh air. You will likely run into him when checking in on our Discord server or Telegram chat group.

Jelle will now be working with Ian and Jules on the VAULT Investment Platform as well.

LinkedIn: <https://www.linkedin.com/in/jelle-b0>

Discord: @J3ll3#9391 [ID: 349292729290850308]

Conclusion

VAULT Investments will do much more than provide an investment platform. The platform we are envisioning will be aiming to fix and improve crypto investing and to make the masternode space in particular a safer place to invest and start new projects.

Many people that we come into contact with on a daily basis, have invested in very promising projects with innovative ideas, but the projects have dropped rapidly in value, with some teams giving up and exiting shortly after, when all seems to have been lost. A lot of investors have had their coins stolen after installing a rogue program or wallet and they are left with a bad experience that they are not looking to repeat.

Some great new projects, with what initially look like having a promising future, can run into blockchain problems and don't have the skilled developers to fix the issues. Others start their project without the basic requirements of a website or whitepaper and their development and growth is hindered by the difficulty of finding reliable, trustworthy and skilled developers .

Crypto is still in its infancy we believe, and can be compared to the Wild West in the US in the previous century. The same freedom and lack of regulation that attracts us to crypto and blockchains, is often the reason why dreams are shattered and good ideas don't work out as intended.

VAULT Investments wants to change all that. It is part of the PAWS Fund family, and like its parent holding company PAWS Fund Holdings, LLC, and sister non profit organisation PAWS Fund, Inc, have honourable intentions of cleaning up the space. We believe by helping others we are helping ourselves. The masternode business is a volatile stage and something has to be done. By creating Vault.investments we are aiming to put value and trust into the markets as a whole and everyone can benefit with more investors capital returning to the markets.

Let it be no secret, that in order for the charity organisation to do its work, there needs to be a source of income other than the unreliable source from donations and the PAWS Donation fund that gets constantly new PAWS added, but is depending on the market value of PAWS on exchanges.

We believe that VAULT Investments is a welcome and suitable new addition to the PAWS family, and will be striving to improve the environment it is operating in.
